

**BRIMAR**<sup>®</sup>  
thermionic products

**APPEAL**

As you may already know, Brimar thermionic products have been working towards bringing cost effective valve manufacturing back to the U.K. We have already commissioned valves which have been finished, tested and packaged in Great Britain as well as designing and producing new valve related products.

After many years of investigation and research, we have finally tracked down the original tooling to make almost every valve ever produced in the U.K. These machines were made by Mullard and came from the Blackburn works, but unfortunately, they are currently located abroad and due to be scrapped, despite being in excellent condition. We have also found and spoken to engineers and workers from the Blackburn plant who are willing to supply their services to help re-commission a new U.K. factory.

We see this as a significant and pivotal moment and our last real chance to bring back the excellent tooling required to make high quality valves. But to begin this task, we need **investment and premises**. We are therefore making an appeal to all constructors, philanthropists and enthusiasts to assist us in any way possible to realise this wonderful dream. If you can help or know someone that can, please contact us via our website -
